

Abstract**A HELPDESK SYSTEM AND METHOD**

5 A remote central helpdesk for a plurality of POS appliances includes a diagnostics engine which, on input of a reported problem, executes a series of manual and automated queries in a sequence determined by a decision tree and by the answers to the queries. The diagnostics engine displays the queries on a display, and prompts the helpdesk operator to answer those queries which

10 require a manual input. Automatic queries are executed by the helpdesk computer which interrogates the POS appliance for any necessary data. The diagnostics engine makes the problem-solving visible to the helpdesk operator, and helps the operator to understand their job and the possible reasons why problems might occur.
